FLENDER Standard Couplings

Flexible Couplings – N-BIPEX Series

General

Overview

N-BIPEX couplings are torsionally flexible and are outstanding for their particularly compact design and low weight.

N-BIPEX couplings are used in many areas of mechanical engineering.

Their main area of use is in electric motor drives which are well aligned and have uniform torque loads, such as in hydraulic applications and in combinations with geared motors.

Benefits

N-BIPEX couplings are suitable for horizontal, vertical and freely selectable mounting positions. They are able to absorb axial, radial and angular misalignment.

N-BIPEX couplings consist of two identical hub parts which can be arranged as required on the shaft extensions to be connected. N-BIPEX couplings transmit the torque positively and are thus fail-safe. The curved design of the cast cams ensures that the N-BIPEX couplings have a perfect pressure distribution and this increases the elastomer lifetime.

The flexible cam rings responsible for torque transmission and misalignment compensation are available in different Shore hardnesses. As a result of the good damping capability and by selecting the suitable stiffness, torque shock loads can thus be absorbed and the torsional vibration behavior of the drive can be positively influenced. Different cam ring versions and ready-to-install hub parts are available from stock.

Application

The N-BIPEX coupling is available as a catalog standard in 10 sizes with rated torques of between 12 Nm and 4650 Nm and is made of high-grade spheroidal graphite cast iron.

The extremely high-performance cam ring materials are available from stock in three different Shore hardnesses with the following colors:

- 92 ShoreA – red
- 95 ShoreA – green
- 64 ShoreD – blue

An additional size marking has been provided on the outer surface of the cam ring to be able to determine the size of the N-BIPEX even when it is in the assembled state without having to use any additional aids.

The coupling is suitable for use at ambient temperatures between -50 °C and $+100\text{ °C}$ without any restrictions on the rated torque as a result of temperature factors.

Coupling suitable for use in potentially explosive atmospheres.

Complies with the current ATEX Directive for:

CE  II 2G c IIB TX
 $-50\text{ °C} \leq T_a \leq +100\text{ °C X}$

CE  II 2D c TX
 $-50\text{ °C} \leq T_a \leq +90\text{ °C X}$

CE  I M2 c
 $-50\text{ °C} \leq T_a \leq +100\text{ °C X}$

Function

The torque is transmitted to the hub at the drive end via the shaft-hub connection, which is mostly designed as a keyway connection, and is transmitted to the hub on the output side via the cam ring. This hub then further transmits the torque to the driven machine or a gear unit placed in between. The special cam ring design helps to keep the compression-loaded cam ring ele-

ments in their defined position under all operating conditions and to keep them evenly loaded. This results in a long lifetime of the flexible elements. A long lifetime is also guaranteed by the hub parts which ensure maximum operational reliability even under harsh operating conditions.

Design

The N-BIPEX coupling of type BWN comprises two identical hub parts connected by a cam ring of elastomer material.

The hubs are connected to the respective shafts via finished bores with parallel keyway connection or Taper clamping bushes.

N-BIPEX couplings are positive-locking and torsionally flexible thanks to the thermoplastic polyurethane cam ring.

Coupling materials

Hubs:

EN-GJS-400-15

Cam ring:

- TPU 92 ShoreA -50 °C to +100 °C without any restrictions
- TPU 95 ShoreA -50 °C to +100 °C without any restrictions
- TPU 64 ShoreD -50 °C to +100 °C without any restrictions

Types of N-BIPEX coupling

Type	Description
BWN	Coupling as a shaft-to-shaft connection with drilled and grooved hubs
BWT	Coupling as a shaft-shaft connection with Taper clamping bushes
BNT	Coupling as a shaft-shaft connection with drilled and grooved hubs and a Taper clamping bush

The coupling comprises the following:

- Cam ring
- 2 hub parts with identical cams. The hub parts are designed with a bore and keyway to DIN 6885-1 or with a taper bore for mounting a Taper clamping bush.

Fitting the clamping bush connects the hub firmly to the machine shaft.

In the case of part 4 the Taper clamping bush is inserted from the machine housing side. If there is insufficient space, the Taper clamping bush cannot be fitted from this side. Besides space for fitting the Taper clamping bush, space for the fitting tool (offset screwdriver) must be taken into consideration. In the case of part 3 the Taper clamping bush is inserted from the shaft end face side. The hub must be fitted before the machines to be connected are pushed together.

Torsional stiffness and damping

The values stated in the above table apply to a capacity utilization of 50 %, an excitation amplitude of 10 % T_{KN} with frequency 10 Hz and an ambient temperature of 20 °C. The dynamic torsional stiffness (C_{Tdyn}) is load-dependent and increases in proportion to capacity utilization. The following table shows the correction factors for different nominal load.

$$C_{Tdyn} = C_{Tdyn} 50 \% \cdot FKC$$

Correction factor FKC	Capacity utilization T_N / T_{KN}						
	20 %	40 %	50 %	60 %	70 %	80 %	100 %
92/95 ShoreA and 64 ShoreD	0.56	0.85	1.00	1.17	1.35	1.53	1.92

Furthermore, torsional stiffness and damping depend on the ambient temperature, the frequency and the amplitude of the torsional vibration excitation. More precise torsional stiffness and damping parameters on request.

With flexible couplings the manufacturing process of the rubber elements and their aging primarily influence the stiffness value C_{Tdyn} . For this reason calculation must be made with a tolerance for the dynamic stiffness of $\pm 20 \%$. The specified damping coefficient Ψ is a minimum value with the result that the damping performance of the coupling corresponds at least to the specified value.

¹⁾ The maximum speed must be observed. Please refer to the Operating Instructions for further information on permitted shaft misalignment.

FLENDER Standard Couplings

Flexible Couplings – N-BIPEX Series

General

Permitted shaft misalignment

The permitted shaft misalignment depends on the operating speed. As the speed increases, lower shaft misalignment values are permitted. The following table shows the correction factors for different speeds. The maximum speed depending on the respective coupling size and type must be observed!

$$\Delta K_{\text{perm}} = \Delta K_{1500} \cdot \text{FKV}$$

	Speed in rpm			
	500	1000	1500	3000
Correction factor FKV	1.20	1.10	1.00	0.70

The axial misalignment may occur dynamically at frequencies up to 10 Hz. For fitting, the maximum gap dimension of $S2_{\text{max.}} = S2 + \Delta S2$ and the minimum gap dimension of $S2_{\text{min.}} = S2 - \Delta S2$ are permitted.

The shaft misalignments ΔK_a , ΔK_r and ΔK_w may occur simultaneously (see [Catalog MD 10.1, page 2/2](#)).

Assignment of N-BIPEX sizes to output P_M of IEC standard motors

The assignment applies for a service factor of 1.25 and the use of a standard cam ring (92 ShoreA).

Ordering example:

N-BIPEX coupling BWN, size 42,

Part 1/2: Bore D1 42 H7 mm, with keyway to DIN 6885-1 and set screw,

Part 1/2: Bore D2 32 H7 mm, with keyway to DIN 6885-1 and set screw.

Article No.:

2LC0160-4AA99-0AA0

LOX+M0T

The Article No. applies to standard cam rings of 92 ShoreA.

¹⁾ Mass moments of inertia apply to a coupling half with maximum bore diameter.

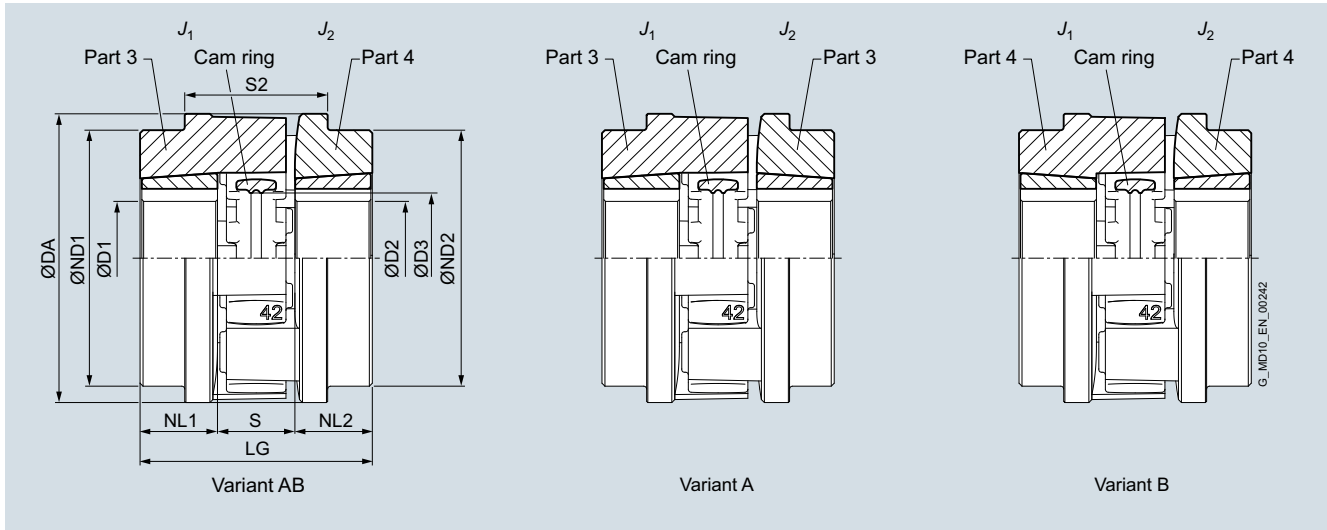

²⁾ Weights apply to the entire coupling in version with maximum bore.

FLENDER Standard Couplings

Ordering example:

N-BIPEX coupling BWT, size 42, variant AB
 Part 3: Taper clamping bush, size 1610,
 bore D1 38 H7 mm, with keyway to DIN 6885-1,
 Part 4: Taper clamping bush, size 1610,
 bore D2 32 H7 mm, with keyway to DIN 6885-1

Article No.:
2LC0160-4AD99-0AA0
LOV+M0T

Article No. applies to standard cam rings with 92 ShoreA.

1) Mass moments of inertia apply to a coupling half without Taper clamping bushes.

2) Weights apply to the entire coupling in version without Taper clamping bushes.

3) Version Taper clamping bushes only available in part 4.

4) T_{Kmax} of cam ring 95 ShoreA is limited to $2 \times T_{KN}$ for types BWT and BNT, contrary to table on page 9/4.
 If cam ring 64 ShoreD is used, the same torque values apply as for cam ring 95 ShoreA.

5) Bores partly with shallow keyway, see catalog MD 10.1, section 14.

The cam rings of the N-BIPEX coupling are wear parts.
The service life depends on the operating conditions.
